TRIPOD STAND MODEL

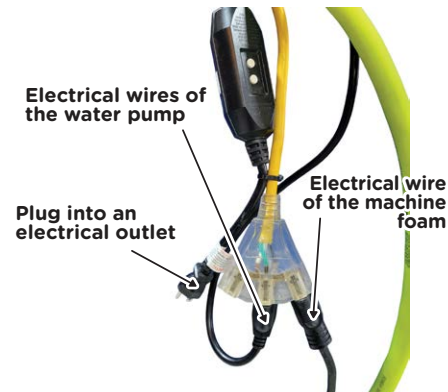

Open the tripod stand to its maximum, then tighten the clamping ring. Insert the safety pin into the first hole. To prevent any risk of instability, do not extend the upper mast. Install the machine on its tripod stand.

Connect the GFCI device located on the side of the barrel to a household GFCI outlet using an extension cord. (Make sure it is grounded)
*Extension cord of a maximum of 100 feet, gauge 14 and less.

Connect the power supply wire of the foam machine and the water pump to the GFCI device located on the side of the barrel.

Connect the water pump hose to the foam machine, making sure the flow valve is in the closed position.

Place the water pump in the barrel, fill the barrel with water to the line indicated on the side, then mix a sachet of foaming product with the water thoroughly.

(You can move the pump back and forth to help you mix your foaming product packet well).

▶ A poorly diluted foaming product packet could cause breathing difficulties due to the very fine particles of the powder. ◀

Use the GFCI device on the side of the barrel to turn on the machine and the pump simultaneously. (Make sure the machine switch located under the carrying handle is in the "ON" position).

Wait until the machine reaches full speed before opening the flow valve. The foam will spurt out after a few seconds.

▶ **Caution:** to prevent water from flowing back into the engine, the fan must always run at full speed before sending the fluid into the foam machine.

To turn off, close the flow valve first, then use the GFCI device on the side of the barrel to turn off the machine and the pump simultaneously.

When finished, please, rinse the equipment before returning it (the tripod stand, the water pump and the barrel).

* Water from a well could affect the quantity and quality of the foam produced.

-Avoid a build-up of foam at the rear air inlet of the machine.

-Keep away from the rear area of the machine any objects that could be sucked up by the fan.

-Do not run around the foam machine.

-Adult supervision is required.

-Be careful not to get water on the electrical connections to prevent any risk of electric shock.
